

This instream habitat and riparian revegetation project began in 2014 in partnership with the U.S. Bureau of Reclamation as part of the Rogue River Basin Habitat Restoration Program, which was established in 2012.

Restoration actions at the project included installation of large wood instream habitat structures, native riparian revegetation, invasive weed management, installation of nearly 5,000 feet of wildlife-friendly livestock exclusion fencing, and installation of a Lorentz solar well pump to support off-channel livestock watering. To implement, maintain, and monitor the project, The Freshwater Trust has held an access agreement with Ari Zaslow since September 21, 2014. A copy of the current agreement (*Riparian Landowner Agreement – Dunn Ranch\_2023*), which expires February 28, 2027, is also included in the folder.

The Freshwater Trust hopes to continue managing and monitoring the project through the end of that agreement term. The remaining documents in the folder include examples of monitoring reports with qualitative observations and photos from 2025 monitoring visits.

In terms of investment at the site, The Freshwater Trust has spent over \$200,000, funded by the Bureau of Reclamation, to implement and maintain the restoration project. A rough breakdown of those costs is below:

Fencing: \$35,000

Riparian revegetation: \$60,000

Lorentz solar well pump: \$12,000

Cultural resource surveys: \$3,500

Large wood material: \$70,000

Stewardship & maintenance: \$30,000

Please note that this estimate does not fully capture the total investment, as it does not include staff time.
